

DFT Lotos

the optimised industrial flooring

The requirements for industrial flooring are constantly growing. Modern industrial flooring should be durable, abrasion-resistant, leak-proof, easy to care for and with a high quality visual finish. DFT Lotos fulfils all these requirements, and therefore is, thanks to its polished surface, an interesting alternative – durable and low-cost – to sealing solutions and coatings.

We add the optimal touch

The base of the DFT Lotos flooring is a cement-bonded DFT industrial coating that receives a permanent optimised surface by means of systematic processing and coating with partially visible aggregates. This results in a significant reduction in cleaning requirements, operating and maintenance requirements without losing the positive characteristics of DFT floors.

Effective and environmentally-friendly revitalisation method

DFT Lotos is also suitable for the revitalisation of old DFT floors. Even with heaving soiling like glue residues, putty and rubber skid-marks it can look like a new floor after the processing, as surface roughness is levelled out and dust gathering pores are minimised. Further advantage: A revitalisation can be carried out even during running business, depending on the local conditions. The process is effected without chemicals.

Surface protection

Optionally, DFT Lotos receives a special surface treatment improving not only the stain protection, but also facilitating the cleaning process.

The protective system is food-safe, open to diffusion and resistant to most aggressive mediums.

Areas of application

DFT Lotos is perfectly suited for industrial halls, logistics halls and other commercially used buildings and also industrial areas frequented by the public like e.g. cash and carry markets, DIY superstores, exhibition halls etc.

Features:

- flat, high-quality and homogeneous surface
- efficient and sustainable
- low maintenance and cost-effective cleaning
- slip-resistant
- jointless
- high levelness
- low wear and low maintenance
- stackers can be operated causing little noise and vibration
- suitable for hovercrafts
